July 7, 2014 (data date through previous Friday close) Volume 5 Issue 27

### All's Well that Ends Well

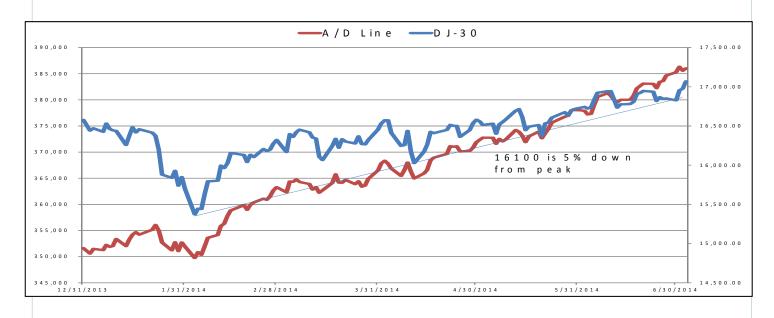

t has been a heck of a rally from the March 2009 low. Over that period the S&P 500 (SPY) has gained 170% or about a 20% average annual return over 5 1/4 years.

That return is marked from a very oversold and undervalued starting point. It helps to "buy low". Measured from the peak in 2000, however, the average annual return is a substantially more muted 1%. These returns exclude dividends.

From the 2009 bottom, the key driver all along has been the Fed flooding the world with easy money (zero interest rates), but the initial trigger off the bottom was the Financial Accounting Standards Board lifting of the "mark to the market" accounting rule 157.

This change allowed banks, brokerages, and real estate com-

(Continued on page 12 see REVIEW on top)

This is the daily chart of the close of the Dow Industrials (blue line) and NYSE advance-decline line (red line)

#### WEEKLY REVIEW

7/7 The jobs report came in stronger than expected. As I've been mentioning, the idea of a stronger economy is not discounted in bonds. Bond investors are seemingly ignoring the fact that the Fed is tapering and is hinting at earlier than expected rate rises.

6/30 The Fed is floating trial balloons about the strength of the economy and ending of QE and possibly raising rates. No portfolio changes.

6/23 No changes. Inflation is picking up, so it will be interesting to see if bonds start reacting, by selling off.

	2010	2011	2012	2013	ytd 2014	Incptn
ETF Income Portfolio	4.8%	3.6	4.8	1.1	0.9	16.1
Aggregate Bond	6.4%	7.7	3.9	-2.2	2.1	18.9

This shows the total returns of previous years, year to date (ytd), and from inception (incptn). It also shows standard deviation (SD).

This is the ETF Income Database and Ranking. It shows performance over the last 12, 9, 6, 3, and 1 months through the previous month's end. V is Volatility. NAV is price. CS is Comet Strength (not shown). C is Comet (not shown), which is an ETF's risk-adjusted performance; the higher the better. V, CS, and C are proprietary tools. Rank column shows the number of comets.

#### ETF LEGEND for pages 3 (Bond), and 7, 8, 9, and 10 (Equity):

Column headings: The first column shows the ETF name, the second column shows it symbol. The third column shows the ETF Style. The first letter is always either B (Bond) or E (Equity) or H (Hybrid). The next letter(s) is the style. So, BS-bond short, BI-bond intermediate, BL-bond long, BF-flexible, BW-world, BHhigh yield. And for Equity, EA-equity aggressive, EC-equity contrary, EG-equity gold (precious metals), ESC -small cap, EMC-mid cap, ELC-large cap, EW-world, EGI-growth/income, ERE-real estate, EV-value. Columns 4-8 shows percentage returns for the periods shown (12 months, 9, 6, 3, and 1 month). Column 9 is V (volatility); a measure of risk; the lower the V, the less risk. Column 10 is the NAV. Column 11 is the C (comet) ranking. C is the risk-adjusted (V) relative performance (CS). The higher the C indicates the most return for the amount of risk taken.

Generally, our ETF strategy is to own the top ranked ETFs (shown in green) and avoid or short the lower ranked ETFs (shown in red).

## SLM Bond Timing Model (preliminary)

The chart above is LQD (corporate bonds) from 10/2003 through the present. The blue portion represents bullish on bond prices (yields falling). The red portion (red prices between red spikes) represents bearish on bond prices (yields rising).

The chart to the left reflects the beginnings of the new Bond Timing model. Right now it is based on LQD (corporate bond ETF).

The reason for the change was there were too many whipsaws in the old model. And I plan to incorporate more information like international bonds, if the back test proves useful.

I plan to also back test this on information before the recent 30-year secular bull market in bonds. In other words, I don't want a model that only works because the wind of lower and lower and lower yields (higher and higher and higher prices) was at its back.

#### WEEKLY REVIEW

7/7 Perhaps the strong jobs report will nudge bond participants from their complacency.

6/30 No changes. Amazing the bond rally in the face of QE termination and economy pickup and inflation strength. Either that, or all the statistics are in error.

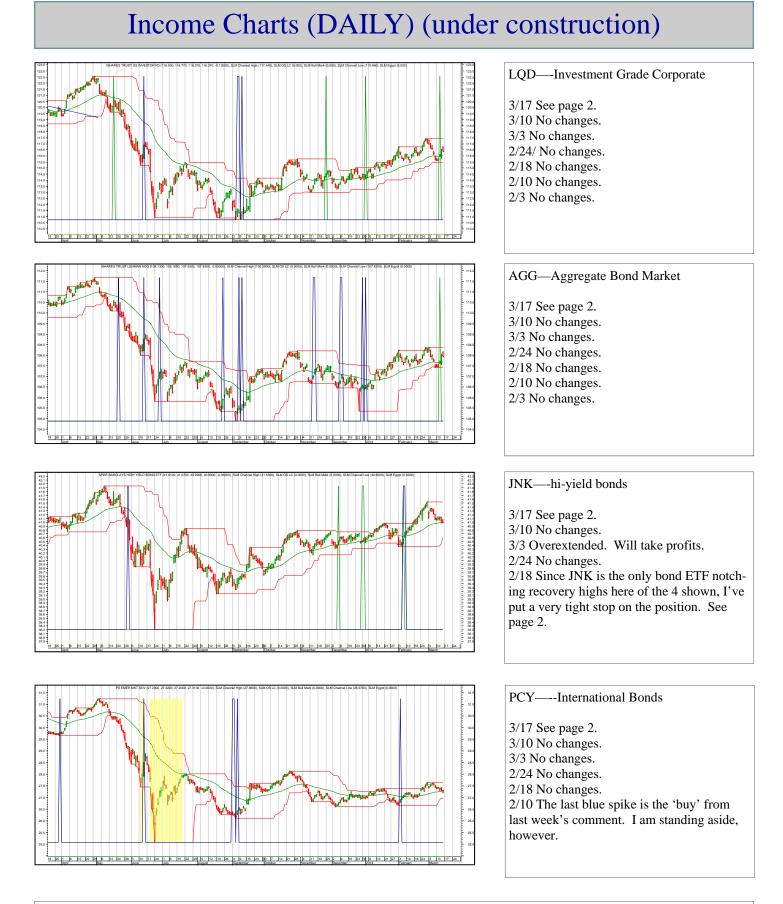

6/23 No changes.

6/16 No changes.

6/9 As mentioned on page 2, if inflation is picking up, we should begin to see this reflected by the market in the form of higher interest rates and lower bond prices.

6/2 No changes.

5/26 No changes. Yields still falling, despite Fed tapering.

Each chart shows daily (or weekly if noted in page title at top) prices, a moving average (smoothed green line on price portion), and blue or green spikes. The spikes show potential buy signals. The red lines are price channels. The charts do not show sell signals.

## Growth Portfolio (changed as of 12/10/12, 9/23/13)

#### WEEKLY REVIEW

7/7 Make the change as noted above.

6/30 No changes.

6/23 Make the sell and buy as noted above.

6/16 No changes.

6/9 With the rally, the stop loss is still 10% away from current portfolio values. Make the sell and buy as noted above.

	2010	2011	2012	2013	ytd 2014	Incptn
ETF Growth Portfolio	8.1%	6.9	-2.1	25.7	5.9	50.5
World Growth Index	17.2%	-4.1	15.1	30.5	6.6	79.9

The ETF Growth Portfolio changed as of 12/10/12 and again 9/23/13. It is following the new World Growth Model (WGM), which uses the same 5 etfs (EEM, EFA, IWM, QQQ, SPY) as the World Growth Index (WGI). The difference between the two is WGM uses timing and WGI is always fully invested and WGI is rebalanced to 20% in each position daily (this accounts for the different returns when WGM is invested and held). Based on the successful back testing strategy, C-lect 5 was added to the portfolio. Returns are of previous years (to last Friday in year), year to date (ytd) (from last Friday in previous year), and from inception (incptn). It also shows standard deviation (SD). The green highlight (2013, 2014) is to highlight the aforementioned changes.

This page and the next three show the equity ETF database rankings from high to low based on C. C is Comet, which is the riskadjusted relative performance; the higher the C ranking, the better. Comets, not stars, because comets, like funds, come into and out of prominence over time. We want the metaphor to match reality.

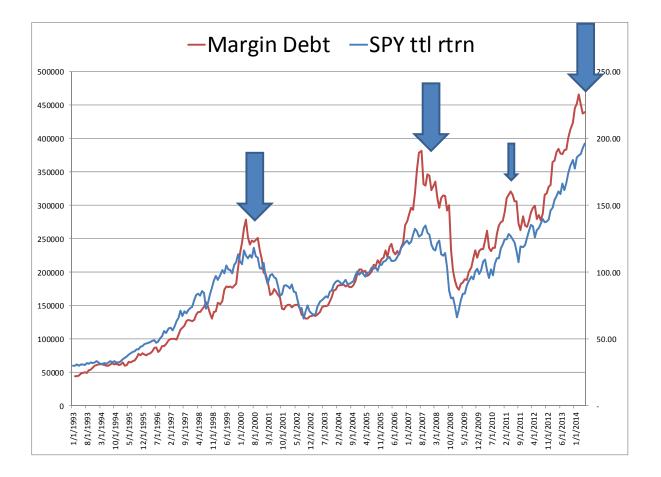

The first column shows the name. The second column shows the symbol. The third column shows the style; it begins with E for Equity and then the style (A is aggressive, W is world, WR is world regional, SC is small cap, MC is mid cap, LC is large cap, GI is growth/income, V is value). The fourth column shows the C level.

## S&P 500 (SPY) and NYSE Margin Debt (updated)

Last week edit: I went back and looked a third time at the two previous tops. For both, the trigger of the subsequent severe sell off was 5%. So if SPY closes 5% lower than its recent peak at 196.5 (below 186.7), odds are that won't be a buying opportunity.

Last week edit:A member asked about depth of loss and duration to bottom of the previous two signals. The first bear lasted 16 months and lost 51%. The second bear lasted 25 months and lost 45%. So IF the market follows the previous averages and peaks this month, the bottom would fall somewhere between 10/15 and 7/16 with the Dow Industrials around 8,400 (current about 16,800).

Previous week: The chart shows the total return (dividends included) of SPY (the S&P 500 etf) (blue line, right scale) and NYSE margin debt (red line, left scale) from 1/29/1993 through 5/31/2014. I shift the margin debt data forward by one month.

As you can see, the two series are closely correlated. But the point is to show that at the two previous major peaks in 2000 and 2007 (large blue down arrows) that preceded 50% losses in SPY, the debt series peaked from 2 to 4 months ahead of the market's peak.

The smaller down arrow marks a coincident peak in 2011 when the market plunged near 20% but did recover. Again, the major peaks were preceded by reductions in margin debt. This is similar to what is happening now. NYSE margin debt peaked in March 2014 (again I shift the data forward one month to make it more timely). The stock market as measured by SPY has continued to climb during April and May.

So, we are now 2 months from the NYSE margin debt peak and entering month 3 with June. If past parameters hold, we are either peaking now or will peak by 7/31. The move thereafter would be another 50% decline.

The reason for this is maintenance. An account with margin debt must maintain enough equity to offset any market decline. If the equity is not enough, then the account must sell to raise cash (or the holder must add cash).

### Overflow from Page 1, Definitions, and Newsletter Updates

#### (Continued from page 1) **REVIEW**

panies great latitude to determine the value of an asset. In turn this kept their debt to value ratios in the solvent column (green), rather than where they perhaps might have been; that is, insolvent (red). The country's companies' dire straights was fairly well hidden from the public.

Some were against this change, but it has all ended well. The economy has recovered and looks self-sustaining. Hence the ending of QE. FAS 157 may also become more strictly applied. After all, asset valuation accuracy is certainly a hinge upon which all investors rely.

So, depending on how one

measures the time frame, it has either been a great time to be an investor in a rip-roaring bull market or an awful time of plodding along since the bubble burst. For our part, since we believe the market has a thing called value, we do try to participate in the up markets and avoid the down markets.

Right now, things are still in gear to the upside (see the chart on page 1). If the markets roll over, no doubt the timing model will signal a sell and avoid. Until then, we'll try to remain in.

See the portfolio pages for any changes.

#### Just to clarify a couple of terms that I use regularly.

Short-term is days to weeks. Intermediate-term is weeks to months. Long-term is months to years. Cyclical is 1-5 years. Secular is 5 years to decades.

Bull market is a series of higher highs and higher lows.

Bear market is a series of lower lows and lower highs.

Neutral market is sideways without a discernible pattern.

Oddly, bull and bear markets may occur simultaneously, but only over different time periods. For example, we may be in a secular bear market, but there are cyclical bull and bear markets within that.

Closing stops are "mental". I look at the position at quarter to the close. If it is trading below the stop (or above if short), then I act with the assumption the security will trigger that closing stop on that day. I sell (or cover) at the close that day.

Portfolio stops for the World Growth Model are internally maintained; they are based on the World Growth Index, not the individual ETFs. Stops will be emailed when close or if triggered.

7/7 No changes. 6/30 No changes. 6/23 No changes. 6/16 No changes.

### Window to Buy (closed as of 7/7/14) Portfolio —Window 800,000 1.0% 700.000 -1.0% 600,000 500,000 -3.0% 400,000 -5.0% 300,000 200.000 -7.0% 100,000 -9.0% 12/5/2002 12/5/2004 12/5/2006 12/5/2008 12/5/2010 12/5/2012

The chart above shows the World Growth Model (Portfolio-blue line) and the Window to Buy (Window-red spikes). The chart covers the period from 12/5/2002 through the present.

The Window to Buy is to answer the question, when should I buy if I missed the initial timing model buy signal, or when do I buy more after my initial position to increase my position with additional money?

Being risk-averse, I wanted a way to answer this sensibly, which is try to buy on measured corrections, rather than chase the market higher and higher. The Window to Buy is the answer. The caveat is that in a strong, early bull market, this approach may miss the early gains, unless you are already following the World Growth Model strategy (and bought on the initial buy). But the rest of the time, the Window is a solid approach to managing portfolio risk. The base line for the Window is 0%. The chart shows +1% to -9%. When the base line is above zero, the Window is closed. It doesn't mean the market can't or won't go higher. It just means that the downside risk to the potential stop or sell signal is fairly wide. When the WGM drops enough, then the Window to buy opens.

When the Window opens, it represents a lower-risk entry period. If the market recovers, the Window will close again. If the market continues lower, either the sell stop will be triggered or the timing model will signal a sell. The timing model sell signal overrides the Window to Buy.

What ideally happens in up markets is the timing model remains on a buy, while the market corrects and opens the Window to Buy. It then reverses and heads higher with more investment dollars on board for the rally.

#### **PORTFOLIO DESCRIPTIONS (pages 2 and 6)**

Our guiding goal is to provide the most return with the least risk consistently through bull and bear markets.

- Income Portfolio, page2: Uses a proprietary selection methodology on all of the monitored bond-oriented ETFs to pick the top ETFs. I then use a proprietary timing model to decide whether to buy, sell, hold, or avoid. From time to time, timing considerations may take precedence over selections; in other words, we may own lower ranked funds because of anticipated timing changes.
- Growth Portfolio, page 6: As of 12/10/12, it is based on the World Growth Index (WGI), which is made up of a static fully invested 20% in each of five ETFs (EEM, EFA, IWM, QQQ, SPY). The Portfolio will buy and sell the WGI based on proprietary timing signals. On 9/23/13, the new C-lect 5 is also part of this portfolio. It too uses timing.

Both portfolios were started on 1/1/10 with \$100,000. As mentioned, the Growth Portfolio strategy was changed on 12/10/12 to the World Growth Model and again on 9/23/13 to incorporate the C-lect 5 model.

Portfolio changes will usually be made at the close on Monday, unless otherwise noted in any emailed hotline update or triggered stop orders. Issues are normally posted on Mondays by 1:35pm cst (Tuesday if Monday is a holiday, defined as market closed). Portfolios are updated through the Friday close the week before.

Dividends are reinvested in additional shares.

Commissions of \$10 per trade are applied. Interest is currently zero for the money market (cash) position.

SUBSCRIPTIONS: To receive *ETF Selections & Timing*, you may subscribe in one of three ways. You may subscribe on the web site InvestmentST.com using PayPal or call 1-800-800-6563 for Amex, Visa, MasterCard, or Discover orders or send a check to the address on the front page. Subscriptions may be tax deductible.

The recurring monthly subscription is \$24.00. An annual subscription is \$240.00. Subscribers receive this weekly eNewsletter. There is no mailed issue. Subscribers retrieve the current weekly issue at the web site InvestmentST.com by logging in with a user name and password. There may also be emailed Hotline reports sent between issues.

Unless otherwise noted, the weekly eNewsletter is posted by 1:35 PM central time each Monday, except for holidays (closed stock market) and then on Tuesday. It may contain actionable, specific buy or sell advice to take that day at the Monday (or Tuesday) close in each portfolio. We may also use stop orders. For stops, check the ETF at quarter to the close. If it is below (or above) a stop level, assume it will close there and act on that. Portfolio data will be updated through the previous Friday's close. Fund symbols, rather than names, are the official identification used for activity.

GUARANTEE: Subscriptions may be cancelled at any time. Annual subscriptions are refundable for the weekly term remaining with a four-week minimum charge, using a 52-week count. Monthly subscriptions just expire.
